Acknowledgements

The contributions within this volume represent some of the research carried out from 1995 to 2001 within the Innovationskolleg “Bewegungssysteme” (Innovation College “Motion Systems”). The research was fostered by the Deutsche Forschungsgemeinschaft (German Science Foundation, INK 22/B1-1), by the Ministerium für Wissenschaft, Forschung und Kunst, Thüringen (Ministry of Science, Research and Art of Thuringia), and the participating universities: Friedrich-Schiller Universität, Jena, and the Technische Universität, Ilmenau. This support provided new facilities and new equipment. Especially, it established an excellent platform for young scientists. The enthusiasm, endurance, and creativity of all participants is greatly acknowledged.

This volume would not have been possible without the patience of G. Hofmann and T. Ertelt.

Reinhard Blickhan

Contents

	<u>Introduction</u>	2
The Innovationcollege „Motion Systems“		
	<u>Bionic design: Actuators</u>	
Aspects of bionics in design		8
Parallel and cascaded arrangement of bioactuators: Orientation of kinesin-mediated force generation in a cell-free system		13
Novel linear drives – Biology as a model		18
Aspects of the design of deformable actuators at the example of earthworms’ movement		23
	<u>Bionic design: Joints</u>	
Structure and functional joints and compliant mechanisms		30
Design of real and technical structures with joints		36
Force transformation in the knee joint – a comparative study		42
	<u>Bionic design: Compliant mechanisms</u>	
Aspects of bionics in design of micro-mechanical systems		49
An approach to the modelling of peristaltic motion using continuum mechanics – First steps in technical realization		52
Miniaturization of a fully compliant, worm-like motion system		58
3-D Muscle modelling by the finite element method		63

Biomechanics of the muscle skeletal system

Estimation and validation of muscle parameters from experimental data using hill-type muscle models	71
Properties of rat m. triceps brachii under locomotion-like condition	76
Measurement of passive moments at the hip joint in the saggital plane	81
Three-dimensional segmental lumbar back mobility	86

Functional morphology and biomechanics of locomotion

Stability of running with elastic legs	92
Attractive motion of biological systems	96
Limits of elastic leg operation	102
Methodological advances in analyses on the motion systems of animals	108
Kinematics of quadrupedal locomotion in arboreal primates	113
Development of locomotion and of the locomotory apparatus in the ontogeny of small mammals	118
A kinematic study of a medium-sized mammal – the domestic goat	122
Dynamics of half-bound and spinal flexion	127
Biological inspiration of a quadrupedal walking machine	132

Muscle activation and controll

Topographic surface EMG characteristics from rat triceps brachii muscle during treadmill locomotion demonstrate selective muscle activation – relations to muscle fibre distribution	138
Dynamic multi-channel EMG patterns of triceps brachii muscle in rats during treadmill locomotion	144
Surface EMG-recordings in small animals using a miniaturised multi-channel matrix electrode: a technical study	149

Three-dimensional evaluation of multi-channel surface EMG for dynamic movements by temporal filtering and investigation of intramuscular coordination in rats during treadmill locomotion	154
Recruitment strategies of motor unit types in tibial anterior muscle during fatigue studied with ³¹P NMR spectroscopy and surface EMG	159
Synchronization of motor unit firings in fatigue: Evidence from surface EMG topography and from motoneuron pool model	165
Investigation of central motor programs using functional imaging	170
List of Authors	174
