für Ruth und Maxine

Foreword

The last decades have seen important changes in the telecommunication market, starting with traditional telephony to multimedia communication, for example by means of the World Wide Web. Network providers are faced with the task of providing network capacity for constantly increasing usage-quality expectations for a new range of applications ranging from multimedia messaging to multipoint videoconferencing. To meet the new demands, the trend in public network systems is changing from circuit-switched technologies to packet-switched technologies. On the one hand this change is related to network capacity gain, and on the other hand to the fact that packet-switching better matches the characteristics of computer generated data. In order to avoid network efficiency trade-offs by lower network predictability, providers must know how to optimize the dataflow avoiding a decrease in the Quality of Service (QoS). The results presented in the following chapters are part of a bigger project regarding QoS, which was carried out in cooperation with the Institute of Hygiene and Applied Physiology (Ergonomics) and the Institute for Computer Engineering and Network Laboratory.

The increase in use of Voice-over-IP and videoconferencing applications shows that the question of accepted thresholds for transmission delays is a central one. The work of the author addresses the question, under which condition delays are perceivable and unacceptable. He stresses these issues from two applied points of view; first in the context of pure human-computer interaction, and second in the context of human-human interaction by means of a computer network.

This research report is split into two sections: 1) a theoretical introduction, and 2) an experimental section. The theoretical part introduces the reader to the background, scope and aims of the investigation and offers a thorough overview of relevant aspects of communication theory, technical definitions, and relevant neural and cognitive theories of time perception as well.

The first experimental part presents the results of two experiments belonging to the human-computer interaction condition. That is, the threshold of a relative delay between auditory and visual information, and the threshold of an absolute delay between a vocal trigger and the disappearance of a visual stimulus in one condition, and an absolute delay between a mouse trigger and the disappearance of a visual stimulus. The second experimental part deals with three experiments belonging to the human-human interaction

condition by means of an experimental computer network. Thresholds of perception and acceptance of absolute delays were measured for simulated real life conditions, showing that the degree of complexity of human-human interaction greatly influences both threshold measures.

The work contributes to three important QoS-aspects. The author has put effort into the development of a model addressing psychosocial aspects of communication beyond the technical aspects. He has adapted an experimental method called best-PEST - well established in controlled laboratory experiments - to more applied conditions. The adaptive best-PEST method has been verified to add value not only to human-computer interaction but also human-human interaction. Lastly, the reader will find a set of tables containing validated thresholds for different kinds of information delays in the context of human-computer and human-human interaction, respectively.

Zürich, August 2003

Helmut Krueger

Acknowledgement

This thesis would not exist without support and cooperation of a number of people, whom I would like to thank:

First and foremost, Prof. Dr. Dr. Helmut Krueger, my promoter, for his keen observation and his valuable advice. He provided an excellent research environment for the achievement of this thesis.

Furthermore, Prof. Dr. Albert Kündig for the hours we spent discussing, and for funding the QED-project, in whose frame I was writing my thesis.

A great thank also to Dr. Sissel Guttormsen Schär who introduced me to the world of scientific research. And to my other colleagues in the research group man-machine interaction, who have contributed in one way or another to make my time at the ETH one that I will always look back to with great pleasure: Marc Arial, Morten Fjeld, Christine Hitzke, Pamela Ravasio, Sam Schluep, and Phillipe Zimmermann.

Thanks also goes to the QED-team members Alexander Braun and Patrik Estermann for the work they have done to implement the videoconference setup and to run experiments.

A special thanks to Kent Riopelle who proofread my thesis and provided valuable feedback to improve its comprehensibility.

Finally, I would like to thank my parents and friends who supported and encouraged me. Most of all, I thank my partner Ruth for her continuous and loving support.

Zürich, August 2003

Hans-Jörg Zuberbühler

*Quid est ergo 'tempus'? Si nemo ex me quaerat, scio;
si quaerenti explicare velim, nescio.*

*What is time then? If nobody asks me, I know; but if I were
desirous to explain it to one that should ask me, I know not.*

Table of Contents

Table of Contents	I
Abstract.....	V
Zusammenfassung.....	IX
1 Transfer to Practice	1
1.1 Regarding Human-Computer Interaction (HCI)	4
1.2 Regarding Human-Human Interaction (HHI)	6
2 Introduction.....	9
2.1 Background and Aims	9
2.2 Scope of Investigation	12
2.2.1 Delay as Quality of Service (QoS) Parameter.....	15
2.2.2 Published Results for Perception and Acceptance of Delay	17
2.2.3 A Psychophysical Approach	19
2.3 Structure of the Thesis	20
3 Theory	23
3.1 A Taxonomy of Communication	23
3.1.1 Social context.....	26
3.1.2 Orientation	27
3.1.3 Coding	29

3.1.4	Modality	31
3.1.5	Timing.....	34
3.1.6	Exemplification of the interpersonal communication model	37
3.2	Processing Time of Auditory and Visual Stimuli.....	40
3.2.1	Indirect: Reaction Time Differences	40
3.2.2	Direct: Event-Related Potentials (ERPs).....	41
3.3	Mental Representation of Time	43
3.3.1	Low Frequency Processing.....	44
3.3.2	High Frequency Processing.....	46
3.4	Neural and Cognitive Models of Time Perception.....	48
3.4.1	Labelled Lines	49
3.4.2	Population Clocks (Neural Networks)	50
3.4.3	Pacemaker-Switch-Accumulator Models.....	52
3.5	Psychophysical Theory for Measuring Thresholds	54
3.5.1	Testing paradigms	54
3.5.2	Specification of the Psychometric function $\psi = f(\phi)$	55
3.5.3	Adaptive Psychophysical Procedures.....	59
4	Experiments	65
4.1	In Human-Computer Interaction (HCI) Mode.....	65
4.1.1	Experimental Setup	66
4.1.2	Procedure.....	66
4.1.3	HCI-Results	70
4.2	In Human-Human Interaction (HHI) Mode.....	74
4.2.1	Experimental Setup	75
4.2.2	Procedure.....	76
4.2.3	HHI-Results	79
5	Discussion and Conclusions	85
5.1	Regarding Relative Delays.....	85
5.1.1	In Human-Computer Interaction (HCI)	85

5.2 Regarding Absolute Delays.....	89
5.2.1 In Human-Computer Interaction (HCI).....	89
5.2.2 In Human-Human Interaction (HHI)	91
5.3 Further Research	97
5.3.1 Relative Delay.....	98
5.3.2 Absolute Delay	98
Annex.....	101
Developed Software: The best-PEST Calculator	101
Description.....	102
Monte-Carlo-Simulations	107
