Acknowledgments

The thesis evolved from my research activities and project work at the Institute of Telecommunications at the University of Stuttgart. First of all, I would like to express my sincere gratitude to Prof. Dr.-Ing. Joachim Speidel for giving me the opportunity to work under his supervision and for supporting me in many regards. I definitively learned a great deal while working with you, not only from a professional but also from a personal perspective. Thank you for all fruitful and encouraging discussions we had. Furthermore, I would like to thank Prof. Dr.-Ing. habil. Helmut Beikirch for the assessment of this thesis.

Another thank you goes to all project partners for their innovative ideas which enriched our discussions and which contributed to the great success of all our projects. It has been a long road to the final working prototype setup. In this regard, special thanks go to the FTZ Leipzig and Dietmar Telschow for organizing numerous meetings and for supporting the extensive measurements campaigns as well as to the IGS Rostock and Dr. Klaus-Peter Kirchner for the inspiring discussions on the MAC layer and the very good cooperation.

I am also very grateful to my former colleagues of the Institute of Telecommunications. Thank you for providing me such a nice and pleasant time. I always enjoyed and will remember our social events and legendary table soccer matches although I lost an incredibly large amount of cookies. Moreover, I would like to thank in particular my former colleagues Matthias and Alex for the great teamwork and the valuable discussions we had. Last but not least the support team of the Institute deserves a big thank you for providing the IT infrastructure and maintaining the lab equipment.

I further like to acknowledge the work of all students who contributed to the projects during their research, student, diploma, and master theses.

A further big thank you deserves my family. Thanks for all your support, proofreading, and encouragement. My most special thanks go to my beloved wife Caecilia. Thank you for being like you are, for having always an open ear, and for your enduring support over the last years. A last thank you goes to Larissa Sophie for being so cute and for limited crying during the exam preparation period.

August 2015
Thomas Handte

"Scientists investigate that which already is; engineers create that which has never been."

Albert Einstein

Contents

Acronyms **xi**

Notations and Symbols **xv**

Abstract **xix**

Kurzfassung **xix**

1 Introduction **1**

2 System Overview **5**

2.1 Low-Level Fieldbus Systems 5

2.1.1 Requirements 5

2.2 System Architecture 6

2.2.1 Basic Modulation and Coding Principles 6

2.2.2 Media Access 7

2.2.3 ISO / OSI Communication Layers 9

2.2.4 Communication Channels 10

2.2.5 Frame Structure and Synchronization Aspects 12

2.3 System Implementation 15

2.3.1 Block Diagram 15

2.3.2 Hardware Implementation 17

2.3.3 Measurement Results 18

3 Fundamentals and Algorithms **21**

3.1 Fundamentals 21

3.1.1 Discrete Multitone 21

3.1.2 Differential Modulation and Demodulation 24

3.1.3 ADC and DAC Distortion 25

3.2 Algorithms 29

3.2.1 Signal-to-Noise Ratio Estimation Techniques 29

3.2.2 Sampling Frequency Offset Mitigation 32

3.2.3 Impulse Noise Mitigation 37

4 Wireline Channel **43**

4.1 Channel Characteristics 43

4.1.1 General Aspects and Definitions 43

4.1.2 Transmission Line Model 44

4.1.3 Line Parameters 45

4.1.4 Crosstalk 46

4.2 Noise Analysis of Multiuser Networks 49

4.2.1 System Model 49

4.2.2 Signal-to-Noise Ratio in Downlink 50

4.2.3 Signal-to-Noise Ratio in Uplink 52

4.3 Optimization of System Performance 54

4.3.1 Minimization of Noise Funneling 54

4.3.2 Optimization of the DAC Operating Point 55

4.4 System Performance of Multiuser Networks 59

4.4.1 Downlink 60

4.4.2 Uplink 62

5 Optical Channel **67**

5.1 Channel Characteristics 67

5.1.1 Light Source Modulation 67

5.1.2 Optical Fiber Properties 69

5.1.3 Limitations of the Optical Channel 74

5.2 System Model and Transmission Techniques 74

5.2.1 System Model 74

5.2.2 DC-biased DMT 77

5.2.3 Asymmetrically-clipped optical DMT 77

5.2.4 Pulse-amplitude modulated DMT 78

5.2.5 Unipolar DMT 79

5.2.6 Digital amplitude-shift keying DMT 79

5.3 Performance Analysis and Optimization 80

5.3.1 Analytical Model in frequency-flat Channels 81

5.3.2 Results and Optimization in frequency-flat Channels 84

5.3.3 Analytical Model for bandlimited Channels 93

5.3.4 Results and Optimization for bandlimited Channels 95

5.3.5 Discussion and Conclusion 98

5.4 Hardware Implementation 99

5.4.1 Transmitter Circuit Design 100

5.4.2 Receiver Circuit Design 103

5.4.3 Optic-Electrical Frontend 110

6 Conclusion **113**

A Mathematical Proofs and Derivations **117**

A.1 Clipping Noise Variance 117

A.2 Derivation of Sampling Frequency Offset Distortion 118

A.3 Sufficient Condition for a Minimum of Noise Funneling 121

A.4 POF Transfer Function with Chromatic Dispersion 122

A.5 Demodulation of PAM-DMT 123
A.5.1 PAM-DMT Signal Symmetry 123
A.5.2 Demodulation of PAM-DMT in frequency-flat Channels 124
A.5.3 Demodulation of PAM-DMT in frequency-selective Channels . . . 125
