## **Acknowledgements**

This dissertation has been developed during my employment as a research scientist at the Institut für Textiltechnik, RWTH Aachen University. At the end of this very significant journey I feel humble and grateful. I want thank a few people who made this journey possible.

I am sincerely thankful to Prof. Gries for the environment of independent working he has created at ITA, and at the same time expecting nothing but the highest standards from his employees. Though I stumbled and fell and got up all by myself, the last five years have marked the steepest rise in my personal growth.

I would like to thank Dr. Gorga, for agreeing to second chair my dissertation and agreeing to attend my defense in Aachen. I am eternally thankful to Dr. Gorga for staying in touch and continuing to support me years after we worked together. Moreover, I humbly thank Prof. Schmachtenberg for being a part of my examination committee and chairing the oral examination procedures.

Furthermore, I would like to warmly thank my colleagues in the secretary's office – Sabine and Caroline, in the machine lab – Dirk, Dirk and Hans, in the testing lab – Michael, Monika, Jennifer, Nadine, Marite and Ursula. I want to further thank my department – my colleagues and ex-colleagues – Tristan, Fabian, Christian, Sven, Frederik, Claus for the great working environment and the constant support. My projects were also often across departments – I would like to thank Bayram, Karl-Heinz, Eric, Marie, Benedikt, Stefan, Jan, Nicole, Achim and Udit for the fruitful collaboration in various projects.

I would also like to thank my students and my 'Hiwis' (student assistants) from the last 5 years, who were a part of the research group 'Textiles and composites from renewable raw materials' and always inspired me with their energies and ideas – Sandra, Jennifer, Harpreet, Marcel, Jeanette, Christoph, Lucas and many more.

A special thanks to Frau Cremer for being so helpful in acquiring the required literature, for helping me compile my bibliography and for maintaining such a

sacred environment in the library. Thank you, Dr. Dieter Veit, for proof reading my thesis and for your constructive inputs to improve my thesis.

The last few years also have gifted me with a few beautiful friendships – Thank you so much Alexandra Jünger, Ingo and Andrea Reinbach, Irene, Stephen, Julian, Florian, Bayram, Eric, Mario, Christopher, Marco and Alex for making this '*Ausländerin*' feel at home. Also thanks to the beautiful friendships I have made as a part of this journey – Neha, Kaustubh, Aditya and Madhura and the Art of Living group.

The constant unwavering support of my family through this challenging journey has given the emotional and moral strength to complete this journey. Thank you Amma, Shankar, Maa and Papa!

Lastly, I thank the two people without whom I wouldn't have come to an end of my PhD journey – Thank you Mohit for never giving up on me.

Avnish, I dedicate this thesis to you, for thank you is too little to express my gratitude!

---

**Contents**

1	Introduction	1
1.1	Current applications of textiles in the automotive sector	1
1.2	Need for raw materials with better environmental impact	2
1.3	Renewable raw materials in the automotive industry	3
2	Research objectives	8
3	Review of bio-based fibres	12
3.1	Natural fibres	12
3.1.1	Flax	16
3.1.2	Hemp	23
3.2	Bio-polymers	25
4	Review of relevant technologies	32
4.1	Nonwoven technology	32
4.1.1	Dry laid technology	33
4.1.2	Air lay technology	36
4.1.3	Needle-punching	38
4.2	Composite technology	40
4.3	Effect of materials, technology and processing on the properties of composites	43
4.3.1	Theoretical models for prediction of composite properties	44
4.3.2	Effect of fibre properties on the properties of nonwovens and composites	47
4.3.3	Effect of nonwoven processing parameters on properties of nonwovens and composites	48
4.3.4	Effect of press moulding properties on the properties of the composites	50
4.4	Weaving technology	52
5	Analysis of eco-design methods	55
5.1	Selection of materials	55

---

5.2	Eco analysis	59
5.3	Eco-design	64
6	Nonwovens and their composites	71
6.1	Investigation of the product	71
6.1.1	Product description of the industrial benchmark	76
6.1.2	Raw materials and technologies used	77
6.1.3	Technical properties	80
6.2	Preliminary trials with alternative materials	84
6.2.1	Characteristics of the alternative materials used	84
6.2.2	Initial trials – manufacturing of nonwovens	86
6.2.3	Process modification	89
6.2.4	Comparison to benchmark	91
6.3	Process analysis	91
6.3.1	Influence of raw materials	92
6.3.2	Influence of process	102
6.4	Pilot manufacturing	107
6.4.1	Definition of prototype product	107
6.4.2	Development of prototype product	110
6.4.3	Analysis of thermoforming process	112
6.5	Technical analysis	115
6.6	Environmental analysis	116
6.6.1	Goal and scope	117
6.6.2	Data accumulation	117
6.6.3	Impact assessment and interpretation	119
6.7	Multi-criteria analysis	133
6.8	Summary	136
7	Woven fabrics	138
7.1	Investigation of the product	138
7.1.1	Product description of the industrial benchmark	140
7.1.2	Raw materials and technologies used	141
7.1.3	Technical properties	142

---

7.2	Preliminary trials with alternative materials	145
7.2.1	Characteristics of the alternative materials used	145
7.2.2	Initial trials – manufacturing of narrow fabrics	146
7.3	Process modification	151
7.3.1	Trials with improved filament properties	151
7.3.2	Comparison to benchmark	152
7.4	Pilot manufacturing	155
7.4.1	Broad fabrics	155
7.4.2	Industry trials	158
7.5	Technical analysis	159
7.6	Environmental analysis	161
7.6.1	Goal and scope	161
7.6.2	Data accumulation	162
7.6.3	Impact assessment and interpretation	163
7.7	Multi-criteria analysis	166
7.8	Summary	168
8	Summary	170
9	Outlook	175
10	List of abbreviations	178
11	Bibliography	182
